

EVENT RACK / STAND

ABSTRACT

A portable and expandable multi-functioning event rack is adapted for use as a bicycle rack, an information displaying apparatus, or as a structure to cordon off an area. The event rack includes support stands with attachment members that removably receive connecting members in a horizontal orientation such that bicycles may be parked on and locked to the connecting members. The connecting members are adapted to connect to adjacent connecting members such that a variously configurable event rack may be created. The support stands are also adapted to receive a mounted member, such as a banner display for the displaying of information or a cover assembly to shelter items from inclement weather.
